

Group Report “Team Ties”

When a team has the same number of members preferring each of the two preferences of a dichotomy, the resulting Type Table generally reports this as a tie (E/I STJ, for instance).

Type theory suggests, however, that like people, a group will have a preference—it will tend as a collective to one side of the dichotomy or the other. Displaying the group as tied is intended to provoke the group into validating the Type of the overall group or selecting the best fit for the group Type. To this end, OKA’s Type Report Writer prints multiple reports for teams with tied results in the hope that the group members will read and consider the Team Type that best fits that group.
